

Screening insight	What we found
Unique-winner problem	Some papers compare several models but do not clearly establish one unique best model.
Metric inconsistency	A paper can call one model "best" while another model has a higher value on an individual metric.
Validation heterogeneity	Papers use different strategies: hold-out splits, k-fold CV, repeated CV, external validation, bootstrapping, etc.
Sample-size variation	The included studies range from very small clinical cohorts to datasets with >100,000 patients.
Winner-verification problem	The stated winner sometimes requires checking the full comparative results rather than relying only on the abstract or conclusion.
